**INDO-SWISS BUILDING
ENERGY EFFICIENCY PROJECT**

**WORLD
RESOURCES
INSTITUTE**

 #energyefficientworld

Energy Efficiency Training Week: Buildings Program

1. **Where to start:** Energy use in buildings
2. **Where to start:** Energy efficiency potential in buildings
3. **Toolkit:** Energy efficient building design
4. **Toolkit:** Energy efficient building technologies
Where do I get help? IEA's Technology Collaboration Programmes
5. **Toolkit:** Energy efficiency policies and target setting
6. **What are the steps?** Enabling investment with energy efficiency policies
7. **What are the steps?** Implementing building energy codes and standards
8. **What are the steps?** Building operations and procurement

Special session. The multiple benefits of energy efficiency

9. **Did it work?** Evaluation and energy efficiency indicators

Where do I get help? International and regional energy efficiency initiatives

10. **Energy efficiency quiz:** Understanding energy efficiency in buildings

9. Did it work? Evaluation and energy efficiency indicators

Trainers: Brian Dean

Purpose: To teach the fundamentals of tracking progress with energy efficiency indicators that are applicable to the buildings sectors. The course will include a discussion of IEA's methodologies and how to collect or model data that can be used to estimate progress from energy efficiency efforts.

Scenario: Leadership wants to know how effective the building energy efficiency policies have been. *How do you determine the benefits of your policies and programmes?*

Evaluation

What is evaluation?

What is evaluation?

Evaluation is an **objective** process of understanding **how** a policy or programme was implemented, **what** effects it had, for whom and **why**.

Leads to **more effective** policies and programmes

When should you evaluate?

Ex-post evaluation

Ex-ante evaluation

The term **ex-post** is a phrase meaning "after the fact"

The term **ex-ante** is a phrase meaning "before the event"

- Management information/reporting
- Measurement e.g. meter readings, compliance data
- Experiments/testing
- Modelling
- Surveys
- Interviews and focus groups

Energy efficiency indicators

Indicators manuals

Indicators data pyramid

Energy efficiency indicators: manuals

Source: IEA energy efficiency indicators

Energy efficiency indicators pyramid

More detailed data is required to get to Level 3 indicators

Energy efficiency indicators pyramid: residential per household

Data and analysis can be used to get end-use and fuel values

Energy efficiency indicators pyramid: residential per floor area

Data and analysis can be used to get end-use and fuel values

Energy efficiency indicators pyramid: non-residential per floor area

Data and analysis can be used to get end-use and fuel values

- Floor area (driver)
 - (Services value added)
- Energy demand
 - Space heating
 - Space cooling
 - Water heating
 - Lighting
 - Miscellaneous energy (“other”)

Tracking progress approaches

Energy performance metrics: Typically primary level indicators (e.g. energy per person) that do not clearly show the role of efficiency.

Energy demand analysis: A “bars held” or “what if” approach by holding indicators constant than can under-estimate energy efficiency gains

Decomposition analysis: Can be complex to understand, but very valuable

Energy performance metrics

Limitations

Energy consumption

Energy per person

Energy per floor area

Limitations of Energy Performance Metrics

- Metrics cannot predict variation in overall energy consumption or quantify the impact of individual components or factors on overall energy consumption
- It is often necessary to undertake more detailed analysis to fully understand the combined impact of a number of different factors or driving forces on overall energy consumption

Building energy performance metrics: energy consumption

What does this tell us about energy efficiency in buildings?

Building energy performance metrics: change in energy consumption

What does this tell us about energy efficiency in buildings?

Building energy performance metrics: energy per person

What does this tell us about energy efficiency in buildings?

Building energy performance metrics: change in energy per person

What does this tell us about energy efficiency in buildings?

Building energy performance metrics: energy per floor area

What does this tell us about energy efficiency in buildings?

Building energy performance metrics: change in energy per floor area

What does this tell us about energy efficiency in buildings?

Building energy performance metrics: key information

How useful is this information in identifying progress?

Building energy performance metrics: choosing the right metric

What are these types of energy performance metrics not telling us about energy demand and efficiency progress?

Behaviour?

Technology?

Efficiency?

Income?

Index: 1990=1. Data for IEA18 (Australia, Austria, Canada, Denmark, Finland, France, Germany, Ireland, Italy, Japan, Netherlands, Norway, Slovakia, Spain, Sweden, Switzerland, UK, USA).
TC: Temperature Corrected.

The right energy performance metric is crucial to understanding & tracking progress over time.

Energy demand analysis

Bars held analysis

- Proportional distribution of energy savings

How much energy service?

Depends on behaviour, income, culture, etc.

How are we meeting energy service demand?

e.g. incandescent bulbs v. CFLs or LEDs

$$Energy_{total} = \sum_{tech} \frac{Energy_{useful} * share_{tech}}{Efficiency_{tech}}$$

How efficient is the technology used?

Decomposition

Logarithmic Mean Divisia Index (LMDI)

Building energy decomposition: breaking down the impacts

**Proportional distribution of energy savings by changing one indicator at a time.
Decomposition analyses can be extremely valuable – but complex.**

Decomposition of global final energy demand in buildings by key contribution

Through decomposition, we can see that energy efficiency is significant, but not keeping up with the growth in total energy consumption in buildings.

Process for Tracking Progress

Key steps in the process

Group exercise

Tracking progress: Key steps in the process

Step 1: Identify what needs to be tracked

- *What story should be told?*
- *What were the objectives?*
- *What are the risks?*

Step 2: Define the tracking indicators

- *What performance metrics can you use?*
- *What data is needed?*

Step 3: Assess the data

- *What analysis method should you use?*

Step 4: Tell the story

- *How do you visualise the results?*
- *How would it vary across countries?*

Example: Tracking progress in the Building Efficiency Accelerator

Scenario:

The Minister wants to know how effective the building energy efficiency policies have been.

How do you go about answering this?

Group exercise:

- *We will split into groups*
- *We will use the data and calculate progress*
- *We will discuss findings in the main group*

Step 1: Identify what needs to be tracked

- *What story should be told about the impact of cooling?*
 - *What objectives could be achieved through policies on cooling?*
 - *What are the risks and threats from increasing cooling energy use?*

Potential issues related to cooling

- *Demand for and access to cooling thermal comfort*
- *Energy used for cooling based on AC efficiency levels*
- *Peak electricity loads, grid stability and power sector investments*
- *Job creation through design, manufacturing, selling or installing ACs*
- *Sales tax and public budgets financial impacts*
- *Market availability of efficient products*

Group exercise: tracking progress on space cooling (example 1)

SEER of air-conditioners by country, 2017

**Best available technology efficiency levels vary widely between countries.
And, best available technology is much more efficient than the market average.**

Step 2: Define the tracking indicators

- *What performance metrics can you use?*
- *What data do you have on cooling and buildings?*

Issues with metrics and indicators

- *How do you separate the influences? (Income; demand; population; climate; efficiency)*
- *What options are there for metrics?*
 - *Final energy use for cooling*
 - *Final energy use for cooling per square meter cooled per cooling degree-day*
 - *Change in average efficiency of ACs (stock, sold, manufactured, imported, exported)*
 - *Share of products covered by labels or MEPS policies*

Group exercise: tracking progress on space cooling (example 2)

Change in global cooling energy use illustrated by different metrics, 2000-15

“Energy use per m² cooled per CDD” may be an accurate performance indicator at the building. But depending on the story you want to tell, “energy use” offers a different story for the country.

Group exercise: tracking progress on space cooling (example 3)

Global weighted average residential SEER of air-conditioners, 1990-2017

**More efficient cooling technologies are being sold.
But the efficiency levels are well below the best available technologies.**

Step 3: Assess the data

- *What analysis method can you use?*
- *Which method will provide the information needed?*

Step 4: Tell the story

- *How do you visualise the data?*
- *What part of the story is important for your country?*

Issues with metrics and indicator analysis methods

- *What results will be compelling and told with simple visuals or statements?*
- *What options are there for methods?*
 - *Energy performance metrics*
 - *Bar chart analysis*
 - *Energy decomposition (LMDI)*

Group exercise: tracking progress on space cooling (example 4)

Share of building energy use covered by regulations, 2000-17

**Increasingly more policies are covering space cooling energy use.
But the strength of those policies are not keeping pace with best available technologies.**

Group exercise: tracking progress on space cooling (example 5)

Global decomposition of final energy use for cooling by key contribution, 2000-15

Energy efficiency has saved 200 TWh of cooling final energy from 2000 to 2015, but this has been offset by activity factors contributing to a 650 TWh increase during this period.

Scenario:

The Minister wants to know how effective the building energy efficiency policies have been.

How do you go about answering this?

Group exercise:

- *Split into groups of 3-4 people*
- *Review the handout, use the data and calculate progress*
- *Return to the main group to discuss your methods and findings*
